Hybrid Electric Power Train Engineering and Technology: Modeling, Control, and Simulation

Part of the Research Essentials Book Series

Antoni Szumanowski
(Warsaw University of Technology, Poland)

Hybridization is an increasingly popular paradigm in the auto industry, but one that is not fully understood by car manufacturers. In general, hybrid electric vehicles (HEV) are designed without regard to the mechanics of the power train, which is developed similarly to its counterparts in internal combustion engines.

Hybrid Electric Power Train Engineering and Technology: Modeling, Control, and Simulation provides readers with an academic investigation into HEV power train design using mathematical modeling and simulation of various hybrid electric motors and control systems. This book explores the construction of the most energy efficient power trains, which is of importance to designers, manufacturers, and students of mechanical engineering. This book is part of the Research Essentials collection.

Topics Covered:

- Drive Architecture Engineering
- Dynamic Modeling
- HEV Design
- Hybrid Electric Battery Modeling
- Planetary Transmission
- Plug-in Hybrid Model
- Power Train Simulations
- Regenerative Breaking
- State of Charge
- Synchronous vs Asynchronous Motor Modeling
